Diana Gomez
Environmental Engineer
InGauge
Level 3, 16 McDougall Street
Milton, Queensland,

Attention: Diana Gomez

Subject: EP187 – Carpentaria-1 Well Flowback Water Risk Assessment
Wastewater Risk Assessment

Dear Diana,

Kleinfelder provides this letter report to comply with Ministerial Condition 3 of the Carpentaria-1 Well, within exploration tenement EP187, approval notice.

The assessment was conducted using laboratory water quality data supplied to Kleinfelder by InGauge. The water samples were collected by InGauge and ALS Environmental measured the analyte concentrations.

All analytes specified in the Code¹ were analysed with the required laboratory limits of reporting.

Analyte concentrations in the water samples were compared against the Australian National Water Quality Management Strategy, which for freshwater refers to the:

- Australian and New Zealand Environment and Conservation Council, 2000. Guidelines for fresh and marine quality water. (ANZECC)
- For water dependent ecosystems and (WDES) 99% species protection (ecosystem with high conservation value).

The assessment objective is to comply with Section C.3 of the Code. It is understood the flowback water is stored on-site in a bunded, above ground, treatment tank with a dry season storage limit of 2.8 ML and a 0.8 ML storage limit in the wet season.

In conclusion:

- The nearest surface water receptor is an unnamed, non-perennial creek located approximately 0.9 km to the Site's south.
- The flowback water analyte concentrations from samples collected exceeded the adopted WDES screening criteria for pH, TDS, some metals, petroleum hydrocarbons (C10-C40) and phenol, indicating that if a release reached the creek or any local waterbody, it would pose an unacceptable ecological risk. It should be noted that the evaporative process to reduce final disposal volumes is anticipated to raise concentration levels of contaminants of concern.
- As per the chemical risk assessment, no chemicals at their maximum concentration, and under a hypothetical maximum release scenario would result:
 - In soil levels above conservative screening criteria protective of terrestrial receptors

¹ Northern Territory Department of Natural Resources, 2019. Code of practice: Onshore petroleum activities in the Northern Territory.

- The avian source-pathway-receptor linkage via accidental ingestion is considered complete, however, the risk is considered reduced as the anticipated water volume ingested would be significantly below the normal daily water intake
- The source-pathway-receptor linkage from storage tank to water beds is considered incomplete for the surface water receptors and improbable to be reached.
- Based on the flowback water storage tank leak and spill precautions at the site the risk to groundwater, soil and terrestrial receptors is considered incomplete.
- Based on the laboratory analyses and this ecological assessment, the flowback water is not suitable for disposal at the site.

1 INTRODUCTION

Kleinfelder Australia Pty Ltd (Kleinfelder) was engaged by Imperial Oil and Gas Pty Limited (Imperial) to complete a risk review of flowback wastewater from the Carpentaria-1 Well (the Site). The well is located within the EP187 tenement and was drilled to assess potential unconventional gas production from the subsurface shale formations. The Site location is shown in **Figure 1**.

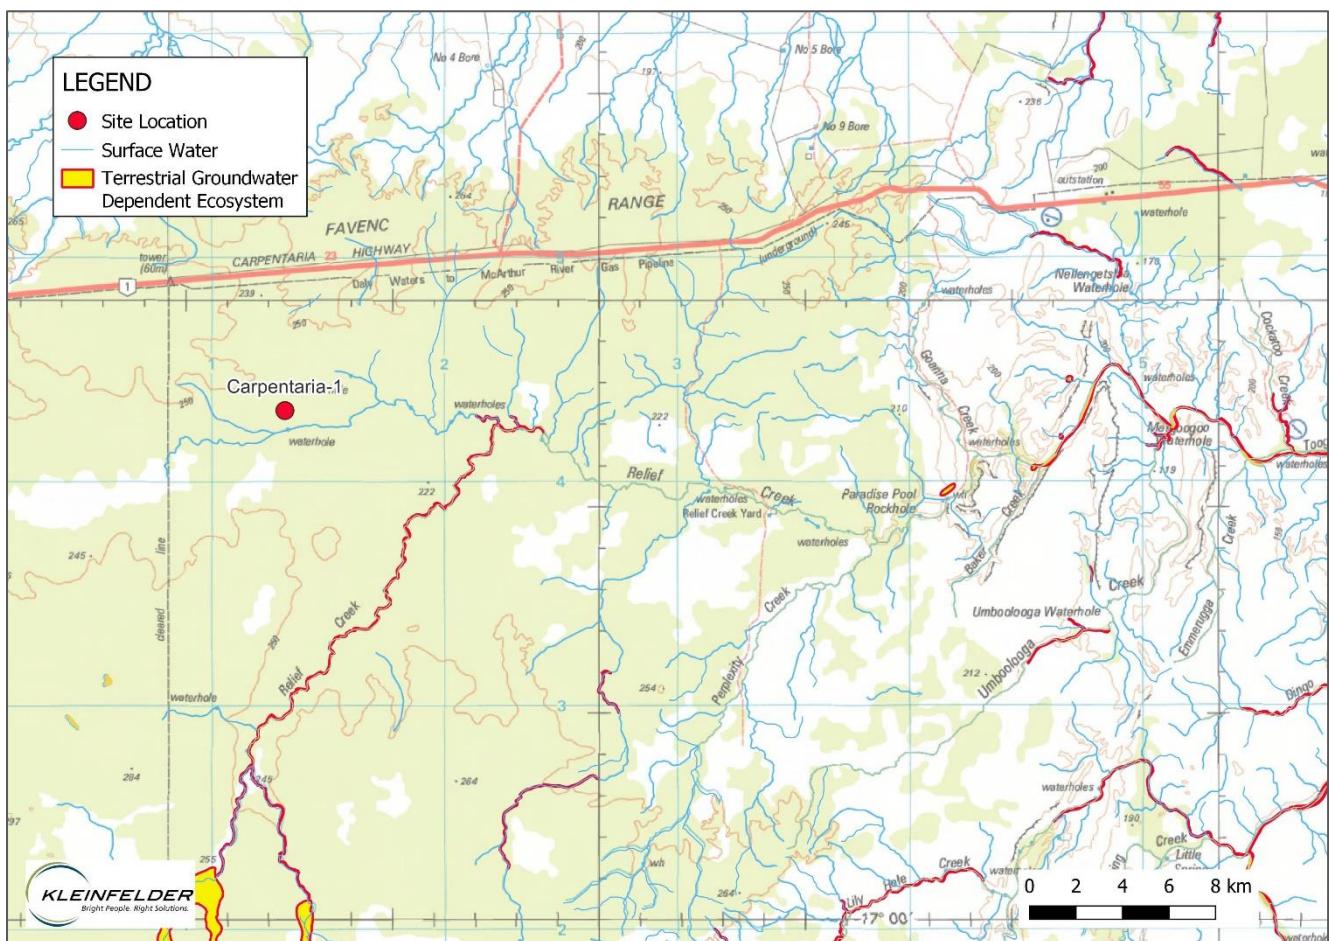

Figure 1: Site location

2 BACKGROUND AND OBJECTIVES

The wastewater on site is a mixture of hydraulic fracturing fluids and geological formation water. Hydraulic fracturing fluids typically contain water, sand and a mixture of additive chemicals that are friction reducers, biocides, stabilisers and corrosion preventers and typically contain elevated salt, metals, organic compounds and have the potential for naturally occurring radioactive materials (NORM)². When the pressure from the hydraulic

² Groundwater Protection Council, 2016. How casing protects groundwater. gwpc.org/topics/hydraulic-fracturing/how-casing-protects-groundwater

fracturing process is released, the injected fluid flows back to the surface (i.e., flowback water or produced water). The flowback water is currently being treated in an above ground tank for future disposal or reuse.

Due to the generally elevated analyte concentrations in flowback water, accidental spills during treatment and transport can pose risks to nearby sensitive receptors. The Northern Territory Department of Environment, Parks and Water Security (DEPWS, formerly the Department of Environment and Natural Resources, DENR) and Department of Industry, Tourism and Trade (DITT, formerly the Department of Primary Industry and Resources, DPIR) sets out the requirements for wastewater management (including flowback water) in a Code of Practice³, which includes the requirement for a wastewater management plan, which contains a risk assessment related to potential impacts from the flowback water to the environment, is provided in the environmental management plan for the Site.

Kleinfelder understands that the flowback water is treated on site in a bunded, double-lined treatment tank with a leak detection system that has a dry season storage limit of 2.8 ML and a wet season storage limit of 0.8 ML. It is understood that following the exploration works completion, the intention is to evaporate as much water as practicable from the treatment tank prior to decommissioning, with the residual waste then being disposed in Jackson, Queensland

Samples from two locations were supplied to the laboratory for chemical concentration determination:

- Choke – a manifold used to control the flowback fluid surface return rate.
- Treatment tank – flowback fluid evaporation treatment tank

The objective of this assessment is to:

- Conduct a qualitative ecological risk assessment (Tier 1) by comparing the flowback water hydrochemical parameters specified in the Code to the adopted WDES screening criteria (**Section 4**).
- Review the risks posed by the flowback water quality to sensitive terrestrial (flora and fauna), soil and groundwater receptors.

It is anticipated that the results from this review will be incorporated into the wastewater management plan risk assessment.

3 SITE SETTING

The Site is situated at approximately 195 mAHD in the Gulf Fall and Uplands bioregion⁴, which has a monsoonal climate (humid, wet summers and dry winters) and is approximately 230 km from the Gulf of Carpentaria. Water courses in the immediate Site area are non-perennial and drain to the McArthur River, which is perennial near the Gulf of Carpentaria.

The nearest surface water body to the Site is an unnamed creek and waterhole located approximately 0.9 km to south. The creek discharges to the non-perennial Relief Creek, approximately 9 km from the Site. Relief Creek has been identified as a low potential terrestrial groundwater dependent ecosystem⁵, suggesting the water table aquifer in the area could be shallow. However, from information provided by InGauge the shallowest groundwater in the Site area is approximately 63 metres below the ground surface.

EHS Support⁶ modelled leaks (1 to 100 kL) and a catastrophic spill (1 ML) from the treatment tank and determined that the risks to groundwater were low and that the released water would be unlikely to migrate further than the well pad (10 ha) via overland flow. The risk of a significant tank leak is managed by bunding and the double lining of the treatment tank. Any ongoing leak from either a tank or inground built pond would be detected by the leak detection system, which would allow early repair, hence reducing any risks.

⁴ Department of Agriculture, Water and the Environment, 2012. Interim biogeographic regionalisation for Australia, Version

⁵ Bureau of Meteorology. Groundwater dependent ecosystems atlas. bom.gov.au/water/groundwater/gde/index.shtml

⁶ EHS Support, 2021. Hydraulic stimulation chemical risk assessment update. Imperial Oil and Gas Exploration Permit 187.

Controls are in place to impede access from native fauna to the tanks, although the accidental use (i.e., a bird inadvertently landing on the water surface in the treatment tank) is considered possible by avian species.

4 SCREENING CRITERIA

The screening criteria was selected based on the site location, receiving water body and terrestrial and avian wildlife. For this, the Australian National Water Quality Management Strategy, 2018, was used which for freshwater refers to the:

- Australian and New Zealand Environment and Conservation Council, 2000. Guidelines for fresh and marine quality water. (ANZECC)
- For water dependent ecosystems and species (WDES) 99% species protection and where applicable “tropical Australia” screening criteria are selected based on the Site’s location.

Where a chemical’s concentration is above the laboratory reporting limit and does not have ANZECC screening criteria, the chemical concentration is screened against:

- National Health and Medical Research Council, 2021. Australian Drinking Water Guidelines 6 2011. (ADWG).
- United States Environmental Protection Agency, 2021. Regional Screening Levels (RSLs). Resident tapwater.

Exceedance of the ADWG or RSL does not necessarily indicate the chemical may pose a risk; the screening is to provide information of where a chemical is present that may require further investigation.

The EHS Tier 1 chemical risk assessment identified that five chemicals within the fracturing fluid required further assessment. The Tier 2 risk assessment determined that the risks posed by the five chemicals were acceptable for human (worker) and avian receptors.

4.1 SCREENED CHEMICALS

The chemicals of concern, with required limits of reporting concentrations, are outlined in Section C.8 of the Code. It is noted that following the submission of the June 2021 choke and treatment tank samples for the majority of metals (total and dissolved) the laboratory LOR was raised from the LORs required by the Code to 10 times higher than the requirement due to sample matrix interferences.

5 LABORATORY RESULTS AND DISCUSSION

All chemicals listed in the Code were analysed at a laboratory with National Association of Testing Authorities accreditation to measure those analytes in water. Laboratory results are summarised in **Attachment 1**, and the laboratory certificates of analysis are presented in **Attachment 2**. Where the laboratory limit of reporting (LOR) is greater than the screening criteria, the analyte is marked as exceeding the criteria.

Water samples from the treatment tank and choke were submitted for chemical analyses, with samples collected on 4th June, 23rd June, 25th June, 4th July, 14th July and 16th July 2021 (14 samples).

The treatment tank flowback water hydrochemical parameters are considered the most important with regards to the screening assessment, as this represents the greatest potential risk to the environment if not well managed. However, it is not anticipated that with the current controls in place, flowback water will present a risk to terrestrial/avian wildlife, water bodies or humans.

5.1 PHYSICOCHEMICAL PARAMETERS

Dissolved oxygen, total dissolved solids (TDS) concentrations and pH values exceeded the screening criteria in the majority of samples.

During a leak or release, the dissolved oxygen would be expected to equilibrate with the atmosphere and hence is unlikely to adversely impact organisms within the surface water receptor; however, the TDS concentration is unlikely to be influenced by this process although it is likely to increase during evaporation.

The treatment tank flowback water TDS concentration exceeds the adopted screening criteria (200 mg/L). The choke sample TDS concentrations are consistently higher than the treatment tank TDS concentration. Choke sample TDS concentrations are influenced directly by salts leached from the formation. Tank sample TDS concentrations would be reduced in the early stage of filling due to the influence of the freshwater used to hold the liner in place initially. As the tank fills TDS concentrations within would be influenced more by the leached salts in flowback. Given the depth of the well, it is possible that flowback water temperature at the choke exceeds that of the ambient standing water in the tank, resulting in solubility differences.

5.2 NUTRIENTS

Nutrients, total nitrogen, reactive phosphorous and total phosphorous concentrations are above the screening criteria in all samples,

5.3 DISSOLVED METALS

Total metal concentrations are not discussed as the ANZECC screening procedure is to assess total metals and then dissolved metals if total metals exceed the screening criteria.

In accordance with the ANZECC, the dissolved metal screening criteria for cadmium, copper, lead, nickel, and zinc have been adjusted for hardness (mean treatment water alkalinity, as $\text{CaCO}_3 = 152 \text{ mg/L}$). The presence of dissolved and total organic carbon can affect metal bioavailability, as metals can adsorb strongly to this material. However, as stated in the ANZECC, the hardness modification is sufficient to account for the organic carbon adsorption influence.

Where ANZECC screening criteria are available, the dissolved metal concentrations in all samples exceeded the screening criteria (see **Attachment 1**). Boron concentrations exceed the screening criteria significantly, however the majority of other metal concentrations generally exceeded the screening criteria by a lesser factor .

5.4 RADIOACTIVITY

There are no ANZECC screening criteria for radioactivity. The adopted screening criteria are from the ADWG; however, it is noted that without knowing the background radioactivity in the regional surface water, a potential impact on a local water-dependent ecosystem is uncertain. In addition, the ADWG screening criteria assumes a mean human daily water consumption is 2 L/day, which would not be a volume consumed by native mammals and birds (see EHS Support report) and the regular consumption of saline water in the flowback water treatment tank by local fauna is unlikely as a freshwater pond is present next to the tank. Nonetheless, as a preliminary screening measure, the ADWG are used to screen the total alpha and beta radioactivity in the waters, with the annual dose calculated using the method in the ADWG Section 7.6.2.

The calculated annual dose for the combined alpha and beta activity exceeded the 1 mSv/year screening criteria in four of the seven treatment tank samples (2.5 to 10.4 mSv/year). It is noted that the three initial samples were below the screening criteria, with the later samples above the screening criteria, which could suggest NORM build-up of radioactive material within the treatment tank. The choke flowback water samples calculated annual doses were above the treatment tank doses in all cases and the screening criteria.

5.5 PETROLEUM HYDROCARBON COMPOUNDS (PHC)

More than one PHC, i.e., benzene, toluene, ethylbenzene, ortho-xylene (BTEX), naphthalene and C6-C40 total recoverable hydrocarbons (TRH), were above the laboratory LOR in all samples.

No BTEX compound concentrations exceeded the screening criteria, although the naphthalene laboratory LOR (5 µg/L) was higher than the screening criteria (2.5 µg/L) in the 4th June treatment tank sample. The naphthalene concentration in all other treatment tank samples was below the laboratory LOR (1 µg/L).

There are no ANZECC high-reliability freshwater TRH screening criteria, however, the marine low-reliability screening criteria (70 µg/L) is exceeded by all samples (180 to 8,680 µg/L) for the C10-C40 TRH fraction.

5.6 POLYCYCLIC AROMATIC HYDROCARBON COMPOUNDS (PAH)

The laboratory LOR specified in the Code is greater than the ANZECC screening criteria for all compounds, where screening criteria are available. However, the only PAH above the laboratory LOR is phenanthrene, where low

concentrations were reported from the choke samples. All treatment tank samples were reported to have PAH concentrations below the LOR.

5.7 PHENOLS

Phenol concentrations were above the screening criteria (85 µg/L) in six of the seven treatment tank samples (105 to 228 µg/L), with only the 4th June sample (79 µg/L) below the screening criteria.

Low 2,4-dinitrophenol concentrations (0.4 to 1.1 µg/L) were reported above the laboratory LOR (0.1 µg/L) in samples collected after 4th June, where the LOR was 4 µg/L.

5.8 ORGANIC CARBON

There are no screening criteria for organic carbon. Total organic carbon concentrations in the treatment tank samples range from 990 to 1,280 mg/L.

6 PETROLEUM (ENVIRONMENT) REGULATIONS 2016 REPORTING

The Regulations⁷, Part 3A, 37A (flowback fluid) and 37B (produced water), subsections 2(a) to 2(h) require the following to be reported to the Minister within six months of the flowback occurring and produced water extraction:

(a) The identity of any chemical or NORM found in the flowback fluid/produced water.

The chemicals required to be monitored are outlined in Section C.8 of the NT Code of Practice: Onshore Petroleum Activities and are presented in **Attachment A**.

(b) The concentration of any chemical or NORM found in the flowback fluid/produced water.

- flowback water results above the laboratory limit of reporting (LOR) from the June 2021 samples were related to total uranium and total thorium (both 0.003 mg/L).
- The dissolved uranium concentration sample was equivalent to the laboratory LOR (0.001 mg/L).
- Uranium and thorium were below the laboratory LOR in all other sample dates, although it is noted that the laboratory LOR was raised from the Code requirement (0.001 mg/L to 0.01 mg/L) in the samples submitted for analysis after June 2021 due to sample matrix interferences.

(c) Details regarding how any chemical or NORM has been or will be managed.

The details regarding how the flowback/produced water management are provided in the site's wastewater management plan⁸, and include:

- Storage and freeboard management – Tanks designed and constructed to Australian Standards AS1554.1 and AS3990,
- double lining,
- fitted with a leak detection system, and
- freeboard of 1.6m for the wet season and 0.5 m in the dry season. The freeboard is maintained by a high-level alarm sensor calibrated for the wet and dry season freeboards. Freeboard was determined for 1:1000 ARI

(d) Details regarding how any chemical or NORM has been or will be transported.

When disposal is required, the wastewater will be transported by providers that comply with NT Waste Management and Pollution Control Act 1998 and have a valid licence under the same Act.

(e) Details regarding how any chemical or NORM has been or will be treated.

Wastewater will be treated in above ground open tanks with the volume reduced through evaporation.

(f) Details regarding any action proposed to be taken to prevent any chemical or NORM spill.

⁷ Northern Territory Government, 2016. Petroleum (Environment) Regulations.

⁸ Imperial Oil and Gas, 2021. Wastewater management plan. 2021 Carpentaria 1 work program. EP187.

Wastewater spill prevention is outlined in the Spill Management Plan⁹, and includes:

- Tanks designed and constructed to Australian Standards AS1554.1 and AS3990
- double lining,
- fitted with a leak detection system
- located within bunded lease pad to contain 110% of the volume of the largest tank,
- Routine inspections for wet and dry season, and
- Procedures to manage water when rainfall events or wet season forecasted.

(g) *Details of the emergency contingency plan included in the environment management plan to which the activity relates.*

An emergency response plan for the site has been prepared¹⁰ and includes management plans for:

- Environmental incidents (hazardous spills) and stakeholder communication and incident (regulatory) notification.

(h) *The requirements in relation to the management of any chemical or NORM of the prescribed chemical legislation.*

Flowback and produced water is managed in accordance with the Code and the approved EMP. The flowback water is classified as listed waste under the Northern Territory Waste Management and Pollution Control Act 1998. Refer to Attachment 06.01 of the EMP for full Chemical Risk Assessment.

7 SOURCE PATHWAY RECEPTOR

EHS conducted a chemical risk assessment for the Carpentaria 1 Well hydraulic fracturing works that identified the following potentially pathways of exposure to flowback water :

Hydraulic fracturing:

- Human and environmental receptors exposed to surface water bodies that received runoff from an accidental release during hydraulic fracturing activities.

Treatment and disposal:

- Human and environmental receptor exposure to flowback water from an accidental treatment tank release.
- Human and environmental receptor exposure to chemicals as a result of accidental release during flowback water transport from the well lease to a disposal/management facility.
- Human and environmental receptors exposed to surface water bodies that received runoff from an accidental release of flowback water.
- Environmental (avian) receptor exposure to open-topped treatment tank flowback water.

7.1 HUMAN RECEPTOR EXPOSURE

Hydraulic fracturing operations and spills are controlled by engineering and management procedures presented in the approved EMP. Some controls include:

Volatile organic compound inhalation is a potential complete pathway for on-site workers; however, no volatile chemicals exceed the probable exposure scenario (NEPM HSL C¹¹). Personal protective equipment is in place to reduce human exposure.

⁹ Imperial Oil and Gas, 2021. Spill management plan. 2021 Carpentaria 1 work program. EP187.

¹⁰ Imperial Oil and Gas, 2021. Emergency response plan. EMP IMP3-4. NT Exploration Permit (EP)187.

¹¹ National Environment Protection (Assessment of Site Contamination) Amendment Measure, 2013. Schedule 1B. Guideline on investigation levels for soil and groundwater. HSL C – recreational open space screening criteria.

The EHS Tier 2 risk did not identify any unacceptable human receptor exposure pathways.

7.2 TERRESTRIAL RECEPTOR EXPOSURE

The site is enclosed by a 2m high fence that restricts access by native fauna and livestock. The treatment tank steel panel construction further restricts the probability that native fauna enter the site inadvertently making it unlikely for livestock to access the stored water.

Compacted soil within the well pad and bunded treatment tank areas protects sub-surface soil from infiltration as well as the spill reaching the surrounding vegetation that could provide habitat for wildlife; thereby reducing any risk to terrestrial receptors from operations.

In addition, the site's Spill Management Plan allows for the efficient containment and remediation of any accidental flowback water release.

7.2.1 Avian Receptor Exposure

The Tier 2 avian receptor exposure modelling indicates that there were no unacceptable risks posed by the water stored in the treatment tanks due to the amount of water that could potentially be intake daily would not exceed the threshold for a hazard quotient.

7.3 SURFACE WATER RECEPTOR EXPOSURE

The EHS surface overland flow modelling indicates that, in the case of a catastrophic treatment tank release the bund will restrict the flow to an approximate five hectare radius, which is within the site boundary, thereby reducing any water migration risk to the nearest surface water receptor (0.9 km).

7.4 GROUNDWATER RECEPTOR EXPOSURE

Compacted soil within the well pad, controls implemented for safe operations, and the distance to the water table makes it unlikely for any spill infiltration to reach the groundwater table. As outlined in the EHS risk assessment; infiltration would take 158 years (through siltstone) and 115 days if the surficial sequence is consistent with limestone to reach groundwater at a depth of approximately 50m below ground level. Therefore, it is not anticipated that a single release would infiltrate to groundwater.

8 CONCLUSIONS

Based on the hydrochemical review, the contaminants of concern are pH, metals, TDS, PHC and phenols in wastewater. The Site is situated in an undisturbed setting and the flowback water is treated in a purpose-built treatment tank. Direct leakage to the nearest surface water receptor is unlikely to be occurring at the present time as this would have been noted by the leak detection unit on the tank. Hence the S-P-R linkages to sensitive receptors is not complete.

From the review undertaken, the following can be concluded:

- Surface water bodies in the Site's regional area are non-perennial, likely only flowing during the wet season.
- The nearest surface water body to the Site is an unnamed creek and waterhole, located approximately 0.9 km to the south. The creek discharges to the non-perennial Relief Creek, which ultimately discharges to the McArthur River and the Gulf of Carpentaria, approximately 230 km to the east.
- Relief Creek is designated a low potential groundwater dependent ecosystem; however, no information was found regarding the presence of a shallow water table in the regional area.
- Accounting for freeboard maintenance requirements, the Site has a capacity to store 2.8 ML of flowback water in the dry season and 0.8 ML in the wet season. The planned disposal method involves water evaporation followed by residual water disposal in Jackson (Queensland).

- The flowback water has pH values and dissolved oxygen, TDS, nutrient, dissolved metals, C10-C40 PHC and phenol concentrations that exceed the WDES screening criteria.
- The evaporation treatment process is anticipated to increase the TDS concentrations and that of other contaminants of concern.
- The S-P-R linkage to the nearby surface water bodies is considered incomplete. The avian S-P-R is considered incomplete for the use of the ponds as a water source. The accidental ingestion pathway is considered complete, but not significant for the current water condition.
- No impact to terrestrial or avian wildlife is anticipated if any incidental spill occurred as it will still be contained within the bunded area
- It will take too long for any spill infiltration to reach 50m depth. It is very improbable that contamination of groundwater table can occur from wastewater contained in the treatment tank.

Based on the laboratory results for the analytes specified in the Code:

- The treatment tank water should not be disposed on the Site surface (including for dust suppression) unless a further ecological and human health risk assessment is conducted (i.e., referring to direct contact and accidental ingestion) and which takes account of concentrating factors following evaporation.
- The water should not be disposed to or in the vicinity of waterways or water bodies.

9 SUITABLY QUALIFIED PERSON STATEMENT

Kleinfelder has nominated Stuart Graham as being a Suitability Qualified Person to undertake the water quality review for Imperial. Stuart's qualifications and experience in the field of water quality assessment are presented below.

Item	Experience
Qualifications	PhD Geochemistry (Monash) New South Wales Department of Planning, Industry and Environment – Suitably Qualified Person to undertake PFAS exposure pathway reviews (surface and groundwater)
Kleinfelder Roles	Associate Hydrogeologist Technical Lead
Relevant Experience	Groundwater dependent ecosystem risk assessments for proposed windfarm quarries where water table lowering was required. Reviewed water table fluctuations and expected impacts to water quality discharging to the GDE. Industrial water quality review for proposed use suitability, including potential human health risks. Multiple water quality and excavation inflow assessments, including assessing suitability for disposal to water infrastructure (sewer). Water quality assessment for irrigation suitability. Ecological risk assessment for hexavalent chromium and nitrate impacted groundwater discharging nearby river, including production of 3D fate and transport model to estimate contaminant mass at point of discharge. Multiple landfill water (and leachate) quality reviews
Memberships	International Association of Hydrogeologists. Association of Applied Geochemists. Australian Land and Groundwater Association.

If you require additional information or clarification, please contact the undersigned at +61 61 7 4957 5036.

Sincerely,

Kleinfelder Australia Pty Ltd

Attachment 1: Laboratory Results Summary

ATTACHMENT 2: LABORATORY CERTIFICATES OF ANALYSIS

CERTIFICATE OF ANALYSIS

Work Order	: ES2122535	Page	: 1 of 19
Client	: IMPERIAL OIL AND GAS	Laboratory	: Environmental Division Sydney
Contact	: JON BENNETT	Contact	: Customer Services ES
Address	: LEVEL 7, 151 MACQUARIE STREET SYDNEY NSW, AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: EP187	Date Samples Received	: 18-Jun-2021 09:20
Order number	: ----	Date Analysis Commenced	: 18-Jun-2021
C-O-C number	: ----	Issue Date	: 05-Jul-2021 13:04
Sampler	: Chris Schilling		
Site	: ----		
Quote number	: SY/153/21 V3		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Titus Vimalasiri	Metals Teamleader	Radionuclides, Fyshwick, ACT
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EK057G, EK071G: LOR raised for Nitrite and Reactive Phosphorus on sample no:7 due to insufficient sample.
- EG035: LOR raised for Mercury due to sample matrix (viscous after adding acid).
- EK067G: LOR raised for Total Phosphorus on sample no:8 due to sample matrix.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EK010, LOR raised due to sample matrix.
- EG020T: Some samples required dilution (X10) prior to digestion for EG020A-T due to matrix interference (high sediment content) and LOR's have been raised accordingly.
- EG020A: LORs have been raised for some samples due to matrix interference (High sample salinity)
- EG020: It has been confirmed by re-digestion and re-analysis that total Zinc concentration is less than dissolved for sample ES2122535-#008. For all other samples and analytes where dissolved is greater than total, the difference is within experimental variation of the methods.
- EP075-EM: Poor surrogate recoveries for sample ES2122535-008 due to matrix interference. Insufficient sample remains to confirm via extraction and re-analysis
- EK059G:LOR raised due to sample matrix.
- EK071G:LOR raised due to sample matrix.
- TDS by method EA-015 may bias high for various samples due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EP002 : It has been noted that DOC is greater than TOC for various samples, however this difference is within the limits of experimental variation.
- EP007 : It has been noted that TIC is greater than TC for sample 3, however this difference is within the limits of experimental variation.
- EP075(SIM), EP071: Particular samples required dilution prior to extraction due to matrix interferences. LOR values have been adjusted accordingly.
- LOR for Gross Alpha and Gross Beta raised due to high solid content.
- EP080: Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.

No. of samples received	: 6		
No. of samples analysed	: 6		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW
Titus Vimalasiri	Metals Teamleader	Radionuclides, Fyshwick, ACT
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP247: Poor matrix spike recovery for particular compounds due to matrix interferences.
- EP247 :Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly.
- EK058G/EK059G: LOR raised for NOx and Nitrate on various samples due to sample matrix.
- EK067G: LOR raised for TP on a few samples due to sample matrix.
- EK026SF: LOR raised for Total CN samples 1,2,3,4,5,6 due to sample matrix.
- EK067G: LOR raised for TP on sample 6 due to sample matrix.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP080: Results for Es2123872-001 and -002 has been confirmed by re-analysis.
- EG035T: Poor matrix spike recovery was obtained for Mercury on sample ES2123872 #2. Confirmed by re-analysis.
- EG035F: Poor matrix spike recovery was obtained for Mercury on sample ES2123872 # 2. Confirmed by re-analysis.
- ED093/EG020: It is recognised that total concentration is less than dissolved for some metal analytes. However, the difference is within experimental variation of the methods.
- EG020: LORs have been raised for some samples due to matrix interference (High sample salinity)
- EK010, LOR raised for Chlorine due to samples matrix.
- EK071G:LOR raised due to sample matrix.
- ED041G:LOR raised due to sample matrix.
- TDS by method EA-015 may bias high for various samples due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- LOR for Gross Alpha and Gross Beta raised due to high solid content.
- EP080: Particular sample(s) required dilution due to sample matrix . LOR values have been adjusted accordingly.
- EP132: Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly.
- EP132: Where reported, Total PAH reported as the sum of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1,2,3-cd)pyrene, Dibenz(a,h)anthracene and Benzo(g,h,i)perylene.

- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.

No. of samples analysed	: 6		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Titus Vimalasiri	Metals Teamleader	Radionuclides, Fyshwick, ACT

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP247: Poor matrix spike recovery for particular compounds due to matrix interferences.
- EP247 :Particular samples required dilution due to sample matrix .
- ED041G: LOR raised for Sulfate on samples 4 and 6 due to sample matrix.
- EK067G: LOR raised for TP on samples 4 and 6 due to sample matrix.
- EK071G: LOR raised for Reactive P on samples 4 and 6 due to sample matrix.
- EK026SF : LOR raised for Total CN various samples due to sample matrix.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP080: Batch ES2125934-4 and 6 results has been confirmed by re-analysis.
- EK010, LOR raised for Chlorine due to sample matrix.
- EG020: LOR's have been raised due to matrix interference. (High Total Dissolved Solids)
- EK071G:LOR raised for Reactive P analysis on samples ES2125934-3 and 5 due to sample matrix.
- ED093/EG020: It is recognised that total concentration is less than dissolved for some metal analytes. However, the difference is within experimental variation of the methods.
- TDS by method EA-015 may bias high for samples 5 and 6 due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- TDS by method EA-015 may bias high for various samples due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EP002: It has been noted that DOC is greater than TOC for sample 3 and 6, however this difference is within the limits of experimental variation.
- LOR for Gross Alpha and Gross Beta raised due to high solid content.
- EP132: Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly. Poor surrogate recovery due to sample matrix interferences.
- EP132: Where reported, Total PAH reported as the sum of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1,2,3-cd)pyrene, Dibenz(a,h)anthracene and Benzo(g.h.i)perylene.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.

Contact	: JON BENNETT	Contact	: Customer Services ES
Address	: LEVEL 7, 151 MACQUARIE STREET SYDNEY NSW, AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: EP187	Date Samples Received	: 27-Jul-2021 06:30
Order number	: ----	Date Analysis Commenced	: 27-Jul-2021
C-O-C number	: ----	Issue Date	: 05-Aug-2021 11:14
Sampler	: Chris Schilling		
Site	: ----		
Quote number	: SY/153/21 V3		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Titus Vimalasiri	Metals Teamleader	Radionuclides, Fyshwick, ACT
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP247 :Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly.
- EP247: Matrix spike recovery not determined due to dilution requirement.
- EK067G: LOR raised for Total Phosphorus on sample 2 due to sample matrix.
- ED041G: LOR raised for Sulfate on sample 2 due to sample matrix.
- EK026SF: LOR raised for Total CN sample1 due to sample matrix.
- Ek026SF: LOR raised for Total CN sample2 due to sample matrix.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EK010, LOR raised due to sample matrix.
- EG035: Poor matrix spike recovery was obtained for Mercury on sample ES2127207 # 2. Confirmed by re-analysis.
- ED093/ EG020: It is recognised that total concentration is less than dissolved for some metal analytes. However, the difference is within experimental variation of the methods.
- EG020: LORs have been raised for some samples due to matrix interference (High sample salinity)
- EK067G:LOR raised due to sample matrix.
- TDS by method EA-015 may bias high for various samples due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EK067G/EK071G: It has been noted that Reactive Phosphorus is greater than Total Phosphorus on sample 1, however this difference is within the limits of experimental variation.
- LOR for Gross Alpha and Gross Beta raised due to high solid content.
- EP080: Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly.
- EP132: Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly.
- EP132: Where reported, Total PAH reported as the sum of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1,2,3-cd)pyrene, Dibenz(a,h)anthracene and Benzo(g.h.i)perylene.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
