Re: Carpentaria 2H and Carpentaria 3H Flowback Wastewater Assessment

---

## Introduction

Imperial Oil and Gas Pty Ltd ("Imperial") is conducting an exploration and appraisal program within Exploration Permit (EP)-187, located in the Beetaloo Sub-basin of the broader McArthur Basin in the Northern Territory (NT). As requested, EHS Support, PTY ("EHS Support") performed a risk assessment on flowback water from the Carpentaria 2H and Carpentaria 3H wells.

The McArthur Basin is located southeast of Katherine, NT, and covers approximately 180,000 square kilometres. Imperial has undertaken exploration activities within EP-187 since 2013. Imperial prepared an Environment Management Plan (EMP), titled Environmental Management Plan Imperial Oil & Gas 2021-2025 EP187 Work Program NT Exploration Permit (EP) 187 (IMP4-3) (Imperial, 2021). The EMP proposed Hydraulic Fracture Stimulation (HFS) to be conducted in 2021 through 2025 at the varied well locations. The EMP IMP4-3 for Imperial did not include use of flowback water for make-up water in the hydraulic fracturing process. Consistent with Regulation 22 of the Petroleum (Environment) Regulations 2016 as in force 1 January 2021 (NT, 2021), an assessment was completed in 2022 to modify regulated activities for the EMP IMP4-3 to include use of flowback water as make-up water in the hydraulic fracturing process (NT, 2022).

The primary objective of this assessment was to satisfy Condition 20 of the NT Government Approval Notice and Statement of Reasons (EMP Reference IMP4-3) which requires a comprehensive risk assessment at each new exploration well (NT, 2021). Additionally, the regulatory requirements for the Carpentaria 2H and Carpentaria 3H wells are under Item 2A of Regulation 37A under part 3A (reporting requirements for hydraulic fracturing) of the *Northern Territory Petroleum (Environment) Regulations* (2016) and the *Code of Practice: Onshore Petroleum Activities in the Northern Territory* ("Code of Practice") (NT, 2023). Regulation 37A states: *A report under subregulation (2) must be accompanied by a full human health risk assessment relating to any chemical found in the flowback fluid.* Flowback fluid is defined as: *fluid that is a mixture of hydraulic fracturing fluid and formation fluid that is allowed to flow from the well following hydraulic fracturing.*

This assessment leverages information in the following documents:

- Environment Management Plan (EMP) – Environmental Management Plan Imperial Oil & Gas 2021-2025 EP187 Work Program NT Exploration Permit (EP) 187 (IMP4-3) (Imperial, 2021).
- Hydraulic Stimulation Chemical Risk Assessment Update – Imperial Oil and Gas Exploration Permit 187 (Appendix 06 of the EMP; Imperial, 2021; and as updated)
- Regulation 22 Flowback Water Risk Assessment (EHS Support, 2022)

## Conceptual Exposure Model

Carpentaria 2H and Carpentaria 3H are located on the Carpentaria 2 well pad in a remote area of the northern NT (**Figure 1**). Approximately 10 kilometres (km) north of the Carpentaria Highway, the Carpentaria 2 well pad is approximately 6.2 hectare (ha) in area. **Figure 2** presents the layout of the Carpentaria 2 well pad, including the 12 megalitre (ML) flowback water storage tank.

Flowback water from the Carpentaria-2H well was used as makeup water for hydraulic stimulation of Carpentaria 3H. According to inGauge, flowback water will be stored on the Carpentaria 2 well lease in the open top tank until either re-use of the flowback as makeup water occurs or off-site disposal at a licensed facility. The next re-use opportunity for the flowback is not projected until second half of 2024. During the intervening time, inGauge anticipates significant reduction in Carpentaria 2H and Carpentaria 3H flowback water volume because approximately 5 millimetre (mm) of fluid is evaporated from the open top tank daily.

The Carpentaria 2 well lease is in a sparsely populated area of the NT (Imperial, 2021). Land use within EP187 is primarily undeveloped with agricultural (e.g., grazing stock) and mining the primary land uses. As shown in Table 10 of IMP4-3, Carpentaria 2 well pad (identified as CARP AA in the EMP) is 14 km from the nearest dwelling (Imperial, 2021). A search within EP187 for Parks, World Heritage Properties, National Heritage Places, Wetlands of International Importance, conservation areas or Sites of Conservation significance did not yield any results. The closest site of significance (Limen National Park) is adjacent to the north-east boundary of EP187 and is greater than 50 km from the Carpentaria 2 well pad.

Climate within EP187 is tropical savannah within the humid zone with distinct wet and dry seasons; rainfall within the wet season averages between 600 to 800 mm per year (Imperial, 2021). Vegetation within EP187 is mostly open forests and woodlands (predominately Dawin Stringybark [*E. tetrodonta*]). Carpentaria 2 well pad is located within the Gulf Fall and Uplands bioregion which includes water holes, gorges, and desiccated sandstone plateaus. Watercourses of varying stream orders are within the broader EP187 (Imperial, 2021). However, consistent with EMP IMP4-3, the Carpentaria 2 well pad is situated outside of sensitive receptor buffer zones, including water courses and is approximately 150 m from the closest stream (Table 10 of IMP4-3; Imperial, 2021). The closest spring to a well pad within EP187 is 22 km.

The Cambrian Limestone Aquifer (CLA) within the Top Springs Limestone, commonly referred to as Tindal Limestone or Gum Ridge Formation, is the shallowest regional aquifer within EP187 (EHS Support, 2023). Infiltration through sinkholes and preferential recharge through soil cavities are believed to be the likely groundwater recharge mechanisms for the CLA (Imperial, 2021). According to the EMP, well pads were to be constructed greater than 1 km from landowner bores and existing water supply bore used for domestic or stock consumption. As shown in Table 10 of IMP4-3, Carpentaria 2 well pad (identified as CARP AA in the EMP) is 8.5 km from the closest bore (Imperial, 2021).

**Figure 1**      **Carpentaria 2 location**

**Figure 2**      **Carpentaria 2 site layout**

In development of the EMP, potential exposures to humans and the environment to chemicals used in hydraulic stimulation were evaluated (Imperial, 2021). Multiple mitigation measures and control measures were specified within the EMP and associated Spill Management Plan (Appendix 07 of EMP) and Wastewater Management Plan (Appendix 06 of the EMP) to reduce residual risks from exposure to flowback water to As Low As Reasonably Practical (ALARP).

As discussed, flowback water from both Carpentaria 2H and Carpentaria 3H is managed in an open top tank on the Carpentaria well pad throughout the year. The flowback water is stored in a 12 ML triple lined tank with leak detections between each liner. A bunded area surrounds the tank to prevent overland flow with a capacity of 400 cubic metres ( $m^3$ ).

An assessment of potential release scenarios from storage tanks was completed as part of the Hydraulic Stimulation Chemical Risk Assessment (CRA) included in IMP4-3 (Appendix 06; Imperial, 2021). In a potential release scenario of 100,000 litres (L) outside of containment and the storage area, the maximum affected area of spreading was estimated to be less than 4.7 ha and limited to the proximity of the release area. Given buffer distances from water courses and size of Carpentaria 2 well pad, potential complete exposure pathways to surface water bodies associated with runoff from an accidental release from the flowback storage tank is considered unlikely and not assessed further. An infiltration assessment was also performed as part of the Hydraulic Stimulation CRA and determined that it would take groundwater 158 years (through siltstone) and 115 days if the surficial sequence is consistent with limestone to reach groundwater at a depth of approximately 50 m below ground level. Given the limited infiltration rate and distance from nearest bore, potential exposure to groundwater affected by a release of flowback water from the storage tank is not considered a complete exposure pathway.

Human receptors identified in the EMP with potential exposure to flowback water stored in tanks or during re-use activities include oil and gas workers (Imperial, 2021). The Carpentaria well pad site is fenced and controlled areas limit access to the public and preclude entry by livestock to the tank. Additionally, the well site is not visible from the closest highway, further reducing the likelihood of potential trespassers entering the secured well pad. Chemical exposures to workers are controlled through engineering, management controls and personal protective equipment, which are focused on elimination and mitigation of the potential for dermal contact and potential for incidental ingestion (therefore, the exposures are considered unlikely). Respiratory protection may not always be standard on hydraulic fracturing worksites; therefore, inhalation of vapours by oil and gas workers was considered a potentially complete exposure pathway for volatile constituents for chemicals used within the hydraulic stimulation process in the CRA. However, as flowback water is stored in open top tanks potential inhalation exposures are considered negligible and will be mitigated by natural ventilation (NICNAS, 2017). Therefore, no complete exposure pathways were identified for human receptors requiring further evaluation in this risk assessment.

Flowback water is typically hypersaline (i.e. total dissolved solids [TDS] greater than 50,000 milligrams per litre [mg/L]), which is unpalatable and a deterrent for avian receptors and other fauna from consuming and interacting with wastewater (Australian and New Zealand Guidelines [ANZG], 2023; Adams et al, 2013; Smith et al, 2010). This is due to the osmotic regulatory (or water balance) requirements of fauna. Ingestion of hypersaline water can lead to dehydration, weight loss, and mortality. The maximum observed salinity ingested by an avian species (Zebra Finch) was 47,000 mg/L TDS. TDS concentrations in the flowback samples from Carpentaria 2H and Carpentaria 3H ranged from 30,600 mg/L to 223,000 mg/L, with an average of 164,021 mg/L (**Attachment A, Table A-1**), and is consistent with a hypersaline characteristic. Avian receptors have reportedly been observed interact in the open top tanks; however, no mortalities have been documented in the

fauna register. Based on hypersaline nature of flowback water, potential exposure to avian receptors is considered low. However, as a conservative measure, potential exposure to avian receptors via incidental ingestion was evaluated in this risk assessment.

Management controls and mitigation measures outlined in the EMP are utilized to minimise potential for releases, including catastrophic failure, from storage tanks. However, as a conservative measure, evaluation of potential release of liquids to soils within the containment area was performed for the Carpentaria 2H and Carpentaria 3H flowback water and exposure to terrestrial receptors was included in this flowback risk assessment.

## Data Used in the Risk Assessment

Carpentaria 2H was stimulated 12 July to 1 August 2022; Carpentaria 3H was stimulated 8 December 2022 to 11 January 2023. Approximately 17,733 barrels (bbls) of produced water from Carpentaria 2H were used as makeup water for stimulation activities at Carpentaria 3H. Flowback water is stored in a 12 meglitre (ML) open top Hydrera steel tank with plastic liners. Consistent with the EMP, an open top tank is used to facilitate treatment by evaporation to reduce flowback water volume (Imperial, 2021).

Fifty-three samples of Carpentaria 2H and Carpentaria 3H flowback water were collected from 6 August 2022 to 5 October 2023. Samples of the flowback water was either collected from the choke manifold or from the storage tank where the flowback water is stored. **Attachment A, Table A-1** presents the analytical data from the weekly sampling events.

Based on the CEM, no potentially complete exposure pathways were identified for human receptors. For avian receptors, the point of exposure is flowback water stored in open-top tanks. Additionally, the terrestrial assessment evaluates releases of flowback water from these tanks. Samples collected from the choke manifold and flowback water tank were used in this risk assessment.

## Avian Risk Assessment

As a conservative measure, an avian risk assessment was completed to evaluate potential exposure of avian receptors to chemicals detected above screening criteria in flowback water samples from Carpentaria 2H and Carpentaria 3H. Laboratory analyses of these wastewater samples for inorganic, organic and radionuclide analytes was completed pursuant to the monitoring wastewater chemistry analytes specified in Section C.8 of the Code of Practice (NT, 2019).

Consistent with the avian risk assessment completed for the stimulation chemical risk assessment (EHS Support, 2023), this avian risk assessment conducted on the flowback water samples included the following two steps:

1. Screening Assessment – Identify chemicals of low ecological concern that do not require additional evaluation in the risk assessment process based on a comparison to the Australian and New Zealand Guidelines (AZNG) for Fresh & Marine Water Quality (ANZG, 2018) trigger values or, absent such values, alternative screening criteria as noted in **Attachment B**.
2. Quantitative Risk Evaluation – Identify chemicals that are a concern for avian receptors, and therefore require an additional evaluation to characterise the potential risks. The potential exposure was assessed using a quantitative evaluation of the potentially complete avian exposure pathway and the screening assessment.

## Tier 1 Screening Assessment

The screening assessment consisted of a focused evaluation of the potential risks to avian receptors if exposed to chemicals detected in flowback/produced water samples (**Attachment B, Table B-1**). The objective of the screening assessment was to identify chemicals of low concern to avian receptors that do not require additional evaluation in the risk assessment process.

The screening assessment used freshwater trigger values (ANZG, 2018) which are deemed to be protective of aquatic species such as fish, invertebrates, and algae assuming chronic, continual, and prolonged contact with surface water at a 95 percent (%) protection level. In instances where no trigger values were available, alternative screening criteria were employed and are noted as such in **Attachment B, Table B-1**. Inherently this approach is considered highly conservative given the following:

- In toxicological testing, aquatic species are more sensitive than terrestrial species to chemicals due to their emersion within the fluid, additional modes of action (for example, impacts on gill function) and the potential for secondary stressors to impact health.
- Even if exposed, avian receptors will have limited periods of duration in contact with the fluids. Roosting, breeding, and continuous access will not occur on the water body; therefore, contact will be episodic in nature and possibly only involve ingestion during dry periods.

Chemicals detected in the flowback/produced water samples with concentrations exceeding the conservatively adopted water quality criteria were carried through the quantitative risk evaluation.

The detected chemicals analysed in the wastewater samples that had concentrations exceeding the conservatively adopted water quality criteria and that may pose a potential risk to avian receptors include:

- |  |   |   |
|--|---|---|
| <ul style="list-style-type: none"><li>• Aluminium</li><li>• Antimony</li><li>• Arsenic</li><li>• Barium</li><li>• Boron</li><li>• Cadmium</li><li>• Chromium</li><li>• Cobalt</li><li>• Copper</li></ul> | <ul style="list-style-type: none"><li>• Lithium</li><li>• Magnesium</li><li>• Nickel</li><li>• p-Cresol</li><li>• Silver</li><li>• Strontium</li><li>• Total Residual Chlorine</li><li>• Ammonia as N</li><li>• Total Phosphorus as P</li></ul> | <ul style="list-style-type: none"><li>• Zinc</li><li>• C6-C10 Fraction minus BTEX (F1)</li><li>• &gt;C10 - C16 Fraction minus Naphthalene (F2)</li><li>• &gt;C16 - C34 Fraction (F3)</li><li>• Gross alpha</li><li>• Gross beta</li></ul> |
|--|---|---|

Results for 3- and 4-methylphenol exceeded the alternative screening value selected for evaluation. However, the results for m-cresol (3-methylphenol) and p-cresol (4-methylphenol) were also available for flowback water. Results for m-cresol did not exceed the corresponding screening level; however, the result for p-cresol did. Therefore, p-cresol was retained to evaluate as a chemical that may potential pose a risk to avian receptors.

The maximum result of total nitrogen exceeded the water quality criteria. Total nitrogen is the sum of total Kjeldahl nitrogen (TKN), nitrate, and nitrite. In the Carpentaria 2H and 3H flowback water, nitrate and nitrite were either not detected or detected at negligible concentrations and TKN is equivalent to the reported total nitrogen concentrations. The maximum concentration of TKN did

not exceed the corresponding water quality criteria; therefore, total nitrogen will not be included for further assessment in this evaluation as the total nitrogen concentration is representative of TKN.

It should be noted that the gross alpha and gross beta screening criteria are only generic screening values for irrigation water. These values are based on risks to human health due to transfer of radionuclides to crop and animal products for human consumption (ANZECC, 2001; ANZG, 2023). These screening values are consistent with the Australian Drinking Water Guidelines (ADWG; National Health and Medical Research Council [NHMRC], National Resource Management Ministerial Council [NRMMC], 2011, and as updated), and if exceeded trigger a more detailed assessment. As outlined in the detailed assessment framework, an order-of-magnitude higher radiological exposure is acceptable as the natural background is higher than the screening level and thresholds for active intervention have been established at corresponding doses 10 to 50 times higher than the corresponding screening value.

In samples of flowback from Carpentaria 2H and Carpentaria 3H, gross alpha and gross beta ranged from 16.6 Bq/L to 669 Bq/L and 38.2 Bq/L to 294 Bq/L, respectively (**Attachment A**). Concentrations of gross beta observed in the Carpentaria-2H and Carpentaria 3-H flowback are within the range of flowback anticipated from the formation (2.08 Bq/L to 431 Bq/L; Kleinfelder, 2021). The observed range of gross alpha in flowback from the Carpentaria 1H well was 8 Bq/L to 82 Bq/L; the majority of gross alpha concentrations in Carpentaria 2H and Carpentaria 3H flowback water exceeded this range.

As discussed above, hypersaline water is unpalatable to fauna and unlikely to be consumed due to the inability for avian receptors. Additionally, precipitation of naturally occurring radioactive materials (NORMs) typically occurs in the flowback tank and accompany non-NORM solids that were produced with the flowback, rather than remaining dissolved in flowback water (Australian Radiation Protection and Nuclear Safety Agency [ARPANSA], 2008). This is supported by the reduction in gross alpha concentration to 102 Bq/L and gross beta concentration of 45.9 Bq/L. Solids within the frac tank will be managed in accordance with the EMP IMP4-3. Therefore, there is no further need to evaluate gross alpha and gross beta in this risk assessment.

**Attachment B, Table B-1** presents the results of the Tier 1 screening level assessment.

## Tier 2 Quantitative Risk Assessment

Potential exposure of avian receptors to the chemicals of concern in the flowback/produced water samples was quantitatively assessed for representative avian species that were previously evaluated in the stimulation chemical risk assessments (EHS Support, 2023). The potential avian exposure pathway was assessed based on the potential ingestion of flowback/produced water by avian receptors using standard methods and in accordance with the methodologies used in the previous avian risk assessments.

Potential dietary intake of water containing these chemicals was compared to toxicity reference values (TRVs) developed specifically for avian wildlife. Exposure assumptions for the dietary intake and TRV development were designed to be conservative to reduce uncertainty in the quantitative risk estimates. The potential risks were estimated using a chemical-specific HQ. As with the human health risk assessment, an HI is the sum of the HQs on an avian species-specific basis. A potential HI threshold level of less than 1 indicates there are no unacceptable exposures to the avian species.

**Table 1** summarises the results of the quantitative risk evaluation and includes a short-term (21-day) and long-term (1-year) scenario of fluid exposure. While there are no projected plans for short-term use or disposal of flowback water, the 21-day scenario provides a range of risk to avian receptors under different temporal scenarios. The HIs for all the assessed avian species were less than the threshold HI of 1 for the 21-day scenario exposure scenarios. Under the longer-term on-site storage scenario, the HIs exceeded the target of 1 and ranged from 6 to 7. Primary risk drivers for this scenario include barium and magnesium.

Given the hypersaline nature of the flowback water, it is unlikely that avian receptors would ingest the flowback water stored in open top tanks. In addition, the evaluation did not account for precipitation of chemicals within the tank or degradation over time. For example, barium and magnesium concentrations in samples collected from the storage tank reduced by 38 % and 57 % respectively from samples collected from the choke manifold. Therefore, the potential for unacceptable exposures to the avian species from potential ingestion of chemicals in flowback is unlikely.

**Table 1 Hazard Indices for Target Avian Species Exposed to Flowback Water**

Avian Species	Hazard Index for 21 days of Storage	Hazard Index for 1 year of Storage
Crested Pigeon	3E-01	6E+00
Willie Wagtail	4E-01	7E+00
Peaceful Dove	4E-01	7E+00
Cattle Egret	3E-01	6E+00
Brown Honeyeater	4E-01	7E+00

**Attachment B, Table B-2 through Table B-7** present the detailed calculations and outcomes of the quantitative risk evaluation for the target avian species in **Table 1**.

## Terrestrial Risk Assessment

This terrestrial soil risk assessment was conducted assuming chemicals detected in flowback water samples would ultimately be incorporated into soils within the bund that could pose an exposure risk to terrestrial receptors. To assess a potential release of liquids to soil within the containment area, concentrations of chemicals in soil that would result from a release of flowback-produced water to soil within the bunded area were calculated. These concentrations were compared, where possible, to ecological soil screening criteria.

### Calculation of Chemical Concentrations in Soil

This terrestrial risk assessment evaluated the potential for a release of flowback from the tank to the bunded area soils. The vertical depth of associated infiltration from this hypothetical release was estimated as 1 metre (m) based on modelling (EHS Support, 2023). Using this information, the area of the bund and the depth of infiltration of the volume of affected soil with the bund area were calculated at 5,000 cubic metres ( $m^3$ ). Maximum and median concentrations of detected chemicals in flowback-produced water from the sampled flowback-produced water samples were used to determine their respective maximum and median concentrations in soils ( $C_{soil}$ ) according to Equation 1 below.

$$C_{\text{soil}} = C_{\text{wat}} \times V_{\text{tank}} / M_{\text{soil}} / D_{\text{soil}}$$

Eq. 1

Where:

- $C_{\text{wat}}$  = maximum detected concentration of chemical in flowback
- $V_{\text{tank}}$  = volume of the water within the bund area in the event of a release (litres [L])
- $M_{\text{soil}}$  = mass of soil ( $6.75 \times 10^6$  kg)
- $D_{\text{soil}}$  = bulk density of soil (1,350 kilograms per cubic metre [ $\text{kg}/\text{m}^3$ ])

The capacity of the water storage tank on the Site is 12 ML and the bunded area capacity is 400 m<sup>3</sup> (or 400,000 L) (correspondence from inGauge). To allow for precipitation, inGauge indicated that 0.5 m and 1.1 m of freeboard are maintained in the tank during the dry and wet seasons, respectively, which reduces the effective storage capacity to somewhat less than 12 ML. To evaluate the potential release to the bund area, a maximum volume of 400,000 L was used in the calculation of soil concentrations.

### Tier 1 Screening Assessment

Chemical calculated maximum and median soil concentrations are presented in (**Attachment C, Table D-1**). These concentrations reflect a range of chemical concentrations potentially expected in the 1-m stratum of soil adjacent to the enclosed storage tanks as a result of a release from the storage tank. Ecological soil screening levels defined by National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM) were used to determine a ratio of the calculated concentration in soil to screening criteria. In certain instances, where NEPM values were not available, other data available from the European Union, the USEPA, or background threshold values for the McArthur Basin surficial soils were used as the screening level.

To determine whether the maximum or median soil concentrations exceeded the screening level, a ratio of the soil concentration to the screening levels was calculated. If the ratio exceeded 1, the estimated concentration for the chemical exceeded the screening level. Calculated ratios did not exceed 1, except for bromide, lithium and strontium. The HQ calculated based on the maximum concentrations for these chemicals only slightly exceeded the target of 1 (2.5, 1.5, and 1.4, respectively) and only bromide resulted in a median concentration exceeding the HQ of 1 at 1.5. Therefore, with the exception of those chemicals, the calculated soil concentrations for both the maximum and median flowback concentrations did not exceed the terrestrial screening levels.

In accordance with the Waste and Wastewater Management Plan (Appendix 06 of the EMP IMP4-3), should a release occur, it would be reported in Imperial's incident reporting system and corrective action would be implemented in accordance with guidance.

### Assessment of BTEX

In addition to the risk evaluations, assessment of benzene, toluene, ethylbenzene, and xylene (BTEX) in flowback water was conducted pursuant to Section B.5 of the Code of Practice (Department of Environment and Natural Resources [DENR] and Department of Primary Industry and Resources [DPIR], 2019). Section B.5 states that recycled produced water used in hydraulic fracturing fluids must not contain BTEX levels greater than those expected in produce water from the well being drilled, or in the event BTEX levels expected in produced water are unknown, then BTEX levels in water cannot exceed levels prescribed in Table 8 of Section B.5.

As shown in **Attachment A, Table A-1**, benzene, toluene and xylene were detected in a subset of samples collected from the Carpentaria 2H and Carpentaria 3H flowback water. **Table 2** presents a

comparison of the maximum detection and limits of reporting from the Carpentaria 2H and Carpentaria 3H flowback data to the BTEX levels in water used for stimulation and drilling fluids from Table 8 in Section 8.5 of the Code of Practice (DENR and DPIR, 2019). Therefore, conditions set forth in Section B.5 of the Code of Practice regarding BTEX are satisfied.

**Table 2 BTEX Evaluation**

Chemical	ANZG (99% Protection Level) ( $\mu\text{g}/\text{L}$ )	Maximum Detection ( $\mu\text{g}/\text{L}$ )
Benzene	600	98
Toluene	180	60
Ethylbenzene	80	< 2
Xylene	200	11

Table Notes:

% = percent

$\mu\text{g}/\text{L}$  = micrograms per litre

< = less than limit of detection

ANZG = Australian and New Zealand Guidelines

## Conclusions and Recommendations

In accordance with Regulation 37A under part 3A of the *Northern Territory Petroleum (Environment) Regulations* (2023) and pursuant to Condition 20 of the EMP approval (NT, 2022), a risk assessment of flowback water from the hydraulic fracturing phase of Carpentaria 2H and Carpentaria 3H wells was conducted. This assessment included determination of potential risk to humans and avian receptors exposed to flowback from wells Carpentaria 2H and Carpentaria 3H. Additionally, an assessment was conducted of a potential release of flowback water to soils within the bunded area. As noted above, the risk evaluation methods used are consistent with those used for the EMP and the hydraulic fracturing fluid risk assessment conducted prior to approval of the activities at the Carpentaria 2H and 3H and well Site (Imperial, 2021).

No potentially complete exposure pathways for humans were identified for the storage of flowback water or potential reuse of water as make-up water. The risk assessment conducted for the avian receptors potentially exposed to flowback/produced water concluded there is no unacceptable risk to these receptors potentially exposed to chemicals in the Carpentaria 2H and Carpentaria 3H flowback water samples. Therefore, with respect to avian use of flowback water from wells Carpentaria 2H and Carpentaria 3H and the approved Site activities and associated management controls, no further action is recommended.

Likewise, a screening assessment was performed to determine the potential risk to terrestrial receptors exposed to soils affected by Carpentaria 2H and Carpentaria 3H flowback water based on a hypothetical release scenario. The assessment consisted of a screening level evaluation to determine if a further quantitative risk assessment would be required to assess the potential risk to terrestrial receptors. This screening level risk assessment concluded that no chemicals detected in the flowback water at their maximum or median concentrations, under a hypothetical maximum release scenario, would result in soil levels above screening criteria protective of terrestrial receptors, except for maximum concentrations of bromide, lithium and strontium, which slightly exceeded the target HQ. Should a release occur, incident notification would occur consistent with the WWMP (Imperial, 2021). Therefore, with the approved Site activities and associated management controls (e.g., maintenance of measures outlined in the EMP), no further action is recommended.

These findings are consistent with the flowback risk assessment that was completed for Carpentaria 1H, which also concluded that there were no unacceptable risks to human or avian receptors. This risk assessment satisfies Condition 20 of the EMP approval (NT, 2022) and requirement 3(a) of Regulation 37A of the Petroleum (Environment) Regulations 2016 (NT, 2023).

**Notes:**

ADWG = Australian Drinking Water Guidelines

BW = body weight

CAS = Chemical Abstracts Service

CW = concentration in water

ECHA = European Chemical Agency

ED = exposure duration

EF = exposure frequency

EPC = exposure point concentration

IR = ingestion rate

mg/kg/day = milligrams per kilograms per day

mg/L = milligrams per litre

TRV = toxicity reference value

1 - EPC is average concentration presented in Attachment A. If constituent was not detected, 1/2 the detection limit was used to calculate the average.

$$\text{Total Intake} = \frac{EPC \times IR \times EF \times ED}{BW \times ED \times 365 \text{ days/year}}$$

$$\text{Hazard Quotient} = \frac{\text{Total Intake } \left( \frac{\text{mg}}{\text{kg-day}} \right)}{\text{TRV } \left( \frac{\text{mg}}{\text{kg-day}} \right)}$$

**Table C-1**  
**Summary of Terrestrial Tier 1 Screening Evaluation**  
**Carpentaria-2H and Carpentaria-3H Flowback Water Assessment**  
**Imperial**

**Notes:**

ACL = Added contaminant limits

As = Arsenic

BTEX = Benzene, Toluene, Ethylbenzene, and Xylene

CEC = Cation Exchange Capacity

Cu = Copper

D = dissolved

DDT = dichlorodiphenyltrichloroethane

ECHA = European Chemical Agency

EIL = Ecological Investigation Level

ESL = Ecological Screening Level

HQ = hazard quotient

mg/kg = milligrams per kilogram

mg/L = milligrams per litre

N = null

NEPM = National Environment Protection Measures

NOAEL = no-observed-adverse-effect-level

NV = No readily available screening criterion

PNEC = predicted no effect concentration

T = total

TPH = total petroleum hydrocarbons

UCL = upper confidence limit

USEPA = United States Environmental Protection Agency

1 = NEPM. 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011.

Table 1B(6) Schedule B (1) - ESLs for TPH fractions F1 – F4, BTEX and benzo(a)pyrene in soil Urban residential and public open spaces.

2 = USEPA 2018. Region 4 Ecological Risk Assessment Supplemental Guidance. Table 3 Region 4 Soil Screening Values for Hazardous Waste Sites Value for mammalian species

3 = NEPM 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011

Table 1B(5)Table 1B(6) Schedule B (1) - Generic EILs for aged As, fresh DDT and fresh naphthalene in soils irrespective of their physicochemical properties.

4 = USEPA 2018. Region 4 Ecological Risk Assessment Supplemental Guidance. Table 3 Region 4 Soil Screening Values for Hazardous Waste Sites Value for avian species.

6 = ECHA 2020. Boron Predicted no effect concentration (PNEC) in soil for terrestrial species. <https://echa.europa.eu/brief-profile/-/briefprofile/100.028.319>

5 = ECHA 2020. NOAEL as concentration in food source for Wistar Han rat

6 = NEPM 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011

Table 1B(3) Schedule B (1) Soil-specific added contaminant limits for aged chromium III and nickel in soil. Areas of ecological significance.

7 = NEPM 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011

Schedule B (1) Table 1B(2) ACL for aged Cu at pH 4.5 and CEC 5.

8 = Background threshold value based on 95 percent upper confidence limit (UCL) of mean for McArthur Basin surficial soils. Note, UCL of the mean represents a central tendency and is conservative to use a central tendency value for comparison.

9 = USEPA 2007. Ecological Soil Screening Levels for Manganese Interim Final OSWER Directive 9285.7-71. Table 2.1-Avian Wildlife Manganese Eco-SSLs (mg/kg dry weight in soil).

10 = ECHA 2020. Molybdenum predicted no effect concentration (PNEC) in soil for terrestrial species. Hazard for Terrestrial Organism.

11 = NEPM 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011

Table 1B(3) Soil-specific added contaminant limits for aged chromium III and nickel in soil. Areas of ecological significance Schedule B (1)

12 = NEPM 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011

Schedule B (1), Table 1B(3) Soil-specific added contaminant limits for aged chromium III and nickel in soil. Areas of ecological significance

13 = NEPM 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011

Schedule B (1), Table 1B(1) Soil-specific added contaminant limits for aged zinc in soil at pH 4 and CEC 5.

14 = NEPM 2011. Guideline on Investigation Levels for Soil and Groundwater. National Environment Protection (Assessment of Site Contamination) Measure April 2011

Schedule B (1) Table 1B(4) Generic added contaminant limits for lead in soils irrespective of their physicochemical properties. Areas of ecological significance.

15 = USEPA 2018. Region 4 Ecological Risk Assessment Supplemental Guidance. Table 3 Region 4 Soil Screening Values for Hazardous Waste Sites Value for soil invertebrates.

16 = USEPA 2018. Region 4 Ecological Risk Assessment Supplemental Guidance. Table 3 Region 4 Soil Screening Values for Hazardous Waste Sites Value for plants.
